Abstract

Co-extinction of mutualistic species - An analysis of ornithophilous angiosperms in New Zealand

Author: Sandra Palmqvist

The avifauna of New Zealand is depleted, affecting their mutualistic relationships negatively and impairing ecosystem functions such as pollination services. Indigenous angiosperms have long been believed to lack major mutualistic relationships with birds due to their absence of common pollination syndromes usually exhibited in ornithophilous plants. This belief has, however, been challenged in later years. This study investigates the association between the method of pollination (bird or other) of New Zealand flora with temporal patterns of abundance, threat status and flower colour. By analysing open access data of herbaria specimens from GBIF.org in R, temporal patterns can be identified. The results show a highly statistical significance from a Fishers test stating an association between pollination method and collection pattern. A decline in abundance of ornithophilous plants after the median year (1980) can also be observed (with a smaller proportion of species with the highest number of collected specimens after the median year) while other pollination method is equally distributed over time. Regarding the threat status of ornithophilous angiosperms: it is more often elevated than for other pollination methods, supporting the decline in abundance. A statistical significance is however absent but could be explained by the inclusive approach used in classifying the pollination method of bird. The analysis of flower colour shows a highly statistical significance meaning that the pollination method matters in the turn-out of flower colour, however, the colour red is only the second most common in ornithophilous species. This supports that using the common pollination syndrome as a method for determining bird pollination in New Zealand is inappropriate. Hopefully, the decline in abundance shown in this study can be mitigated through successful conservation efforts of mutualistic species.

Key words: mutualistic disruptions; herbaria specimens; temporal abundance; bird pollination; New Zealand

Populärvetenskaplig sammanfattning

Samutrotning av mutualistiska arter - En analys av fågelpollinerade angiospermer i New Zealand

Författare: Sandra Palmqvist

Biodiversiteten på avlägsna och isolerade öar har påverkats negativt efter människans ankomst. Detta har till stor del skett på grund av förändring av naturområden och introduktion av främmande arter vilket har lett till en ökning av utdöendet hos inhemska arter. Idag återfinns enbart en liten andel av den ursprungliga sammansättningen av ö-specifika (endemiska) fågelarter i Stilla havet, vilket i sin tur påverkat de växter som förlitar sig på fåglar för sin pollinering (som är en viktig del i växternas fortplantning). På Nya Zealand har man länge trott att det inte funnits så många växter som förlitat sig på fågelpollinering, alltså en avsnad av mutualism dem emellan, eftersom de inte uppvisar de klassiska kännetecknen för fågelpollinering (pollineringssyndrom). Dessa morfologiska egenskaper har historiskt sett använts för att bedöma hur en växt sannolikt blir pollinerad. Fågelpollinerade blommor uppvisar vanligtvis stora, rörförmliga, röda, doftlösa blommor innehållande mycket nektar på en stadig stam. Detta är dock baserade på hur fågelpollinerade blommor ser ut i andra länder. På Nya Zealand uppvisar blommorna en mer generell utformning där de kan utnyttja mer än bara en pollinerare, till exempel även insekter.

I den här studien tittas det närmare på hur olika pollineringssmetoder (fågel jämfört med övriga) förhåller sig i jämförelse med ett antal andra faktorer. Först inhämtades data över insamlade växter som bevarats i herbarier. Exemplaren av varje art sammantäldes med hjälp av mjukvaran R och fördelningen hos varje art beräknades och grupperades i två grupper: arter med flest insamlade exemplar före eller efter medianen av hela datasetet, vilket var året 1980. Sedan utfördes ett statistiskt test för att se om fördelningen hos de båda grupperna var den samma. Resultatet visade att så inte var fallet, den var olika. Om man tittar på den procentuella fördelningen av arter inom de båda pollineringssmetoderna så ser man att antalet fågelpollinerade arter (där flest herbariaexemplar bevarats) är färre efter 1980 medan den är den samma för andra pollineringssmetoder. Detta visar en nedgång av förekomsten av fågelpollinerade växter över tid.

Efter detta så jämfördes bevarandestatusen hos inhemska växter på Nya Zealand, mot pollineringssmetoden. Här saknade det statistiska testet en signifikans vilket skulle kunna förklaras med att en inkluderande metod användes i klassificeringen av fågelpollinerade arter, där även misstänkt men ej definitivt bekräftade fågelpollinerade arter inkluderades vilket skulle kunna späda ut resultatet. Resultaten uppvisar dock en något högre andel av hotade arter bland de fågelpollinerade än bland övriga pollineringssmetoder. Detta skulle kunna styrka de tidigare resultaten från herbariaexemplaren och peka åt samma håll, alltså att fågelpollinerade arter är mer

hotade än andra. En framtida jämförelse av förändringen av bevarandestatus över tid skulle vara av stort intresse för att kunna säga detta med säkerhet.

Slutligen analyserades blomfärg genom ett statistiskt test där färgernas fördelning jämfördes mot pollineringssmetoden. Resultaten visade att sättet en blomma pollineras på bör påverka sannolikheten för vilken färg blomman har. Röd blomfärg är dock bara den näst vanligaste färgen hos fågelpollinerade växter och bara en liten andel av alla röda växter är fågelpollinerade. Detta innebär att det inte är särskilt lämpligt att använda pollineringssyndrom för att bestämma pollineringssmetod på Nya Zealand och har troligtvis bidragit till att man tidigare underskattat fåglars betydelse som pollinerare på öarna. Förhopningsvis kan man motverka en fortsatt framtida nedgång av fågelpollinerade växter genom olika bevarandeinsatser. Om fåglarna inte dör ut så kan de fortsätta pollinera blommorna.

1. Introduction

Humans have not only caused major global climate change through overexploitation of natural resources, but we have also increased the extinction rate of floras and faunas and are now risking major ecosystem failure throughout the globe (Regan et al., 2015). Remote islands have seen such negative effects after human arrival and expansion (Bellard et al., 2016; Steadman, 1989). Native species have not only been affected by habitat change but also by direct hunting and the intended or accidental introduction of invasive species such as predators, parasites, diseases, herbivores or exotic plants that outcompete indigenous species (Bellard et al., 2016; Bellingham et al., 2010; Case, 1996; Cox & Elmquist, 2000; Duncan & Blackburn, 2007; Norton, 1991).

Islands differ from the mainland in some key aspects, where the degree of isolation is an important factor (Gillespie et al., 2008). The highest number of isolated islands are found in the Pacific Ocean and their geographical remoteness acts as an obstacle for species to migrate (Gillespie et al., 2008). This in turn affects the richness in biodiversity negatively and isolated islands are also known for their high number of endemic, endangered and extinct species (Gillespie et al., 2008). The high level of avian extinction, as much as two out of three species, that has been found on the islands of the southern Pacific Ocean means that the remaining survivors on these islands cannot be said to represent the original distribution of birds in the area (Steadman, 1989). Bellard et al. (2016) showed that out of the extinct birds (or extinct in the wild) found in the IUCN Red List from 1500 AD till present, 93% was island dwelling and using fossil records Steadman (1989) showed that it was mainly flightless and endemic birds that had gone extinct. Case (1996) states that the composition of bird species on islands have homogenized. This is due to the endemic bird species having been replaced by exotic ones, leading to a global decline in the total number of bird species even though the number of species on each island may remain the same (Case, 1996).

When the natural habitat is disturbed, it does not only limit the resources for native species, but it also invites introduced species to settle (Case, 1996). Invasive species move in to occupy new niches that they are already accustomed to, while the indigenous species are not given the chance to evolve and adapt to the rapidly changing environment in time, making them unable to compete with the settlers (Case, 1996; Cox & Elmquist, 2000). The settlers rarely replace the same niche as an extinct native species either (Case, 1996). This can be seen in New Zealand where the giant flightless moa bird (Dinornithiformes) has gone extinct but it has not been replaced by an alien species occupying the same niche as a browser, instead small introduced thrushes (Turdidae) and finches (Fringillidae) that feed of seeds, insects and invertebrates have established on the islands (Case, 1996; Clout & Hay, 1989; New Zealand Birds Online -The digital encyclopedia of New Zealand birds, 2013a-f). Heinen et al. (2018) also states that flightless birds are more threatened from invasive species than their flying relatives since they are more vulnerable to, for example, predation. The elevated vulnerability to alien predators for endemic flightless birds is not only due to their flightlessness but also stems from a naivety and lack of natural escape responses to introduced mammals such as cats (*Felis catus*) or rats (*Rattus* spp.) (Bellard et al., 2016; Duncan & Blackburn, 2007).

Introduced species are also unlikely to replace indigenous species as pollinators (Kelly et al., 2006). When it comes to bird pollination of flowers in New Zealand only one in twenty of the total flower visitations are made by introduced species of birds (Kelly et al., 2006). This can prove devastating since there are only three extant indigenous bird species responsible for a whole 89% of all observed flower visitations (Kelly et al., 2006). In New Zealand most of the indigenous bird species have already gone extinct or are currently threatened and a further decline in bird population can be observed (Barnett, 2011). Recent conservation efforts to create protected areas of little or no mammal invaders have however shown positive trends in slowing down or reversing the decline of the endangered native bird species (Bellingham et al., 2010; Bombaci et al., 2018; Burns, 2013). This has in turn shown an improvement in the fruit setting of the plants in these conservation areas indicating an increased pollination success (Bombaci et al., 2018; Burns, 2013; Van Etten et al., 2018)

Mutualism between species is an important piece of the puzzle when it comes to ecosystem functions and a mutual relationship is beneficial for both species (Burns, 2013). One very important factor for the prosperity of plants is the pollination success (Anderson, 2003), however, a heavy reliance on a few specific pollinators leaves the plant species vulnerable if their partnering pollinator disappears (Rumeu et al., 2017). It is well known that the indigenous avifauna on New Zealand is diminished (Kelly et al., 2010). The effect of which is of interest for this study that will specifically look at the ornithophilous angiosperm flora of New Zealand and their declining success rate due to its dwindling mutualistic avifauna.

The belief that the New Zealand flora have a poorly developed mutualistic relationship or dependency on bird pollinators has been widespread (Clout & Hay, 1989). This belief likely stems from the lack of common pollination syndromes that is found in bird-pollinated flowers in other parts of the world (Cronk & Ojeda, 2008; Wang et al., 2020). Morphological traits that are accepted for ornithophilous flowers are big, tubular flowers on a sturdy stem that the birds can sit on while they feed of the nectar, except for in-flight feeders such as Hummingbirds (Cronk & Ojeda, 2008). One common trait of bird-pollinated flowers is also that they lack scent but have a big and high energy nectar load (Cronk & Ojeda, 2008). Another is that ornithophilous flowers are commonly known to be red or reddish in colour (Cronk & Ojeda, 2008). This belief has, however, been challenged in later years (Wang et al., 2020). It has been shown that plants that are known to be visited by birds, but where ornithophily was dismissed due to the morphology of the plant being traditionally more suited for insect pollination (entomophily), achieve significantly less pollination when shielded from birds in experiments (Anderson, 2003). Studying the relationship between plants and birds has also been difficult as birds visit flowers at an elevation above ground that are outside of easy human reach (Robertson et al., 2008). This, combined with many indigenous plants showing a generalist behavior when it comes to pollinators as well as morphology, has made the assessment of the importance of birds as pollinators in New Zealand difficult (Kearns & Inouye, 1997; Newstrom & Robertson, 2005).

The goal of this study is to examine if this has had an effect on the abundance of the native flora through investigating the association between pollination method to a number of variables. The number of collected herbaria specimens of flowering plants in New Zealand will be examined to assess if they show temporal patterns and whether a decline in bird pollinated plant species in modern history can be observed, as described by Kearns et al. (1998) and Regan et al. (2015). The conservation status of indigenous plants will also be investigated in order to examine the association to pollination method and whether this affects the level of threat status, as suggested by Robertson et al. (1999). To test whether the common bird pollination syndrome can be applied as a general rule on New Zealand flora (Cronk & Ojeda, 2008), or if this is an inaccurate statement (Wang et al., 2020), the flower colours of indigenous angiosperm plants will be analysed in relation to pollination method.

The following research questions are assessed: (1) Has the pollination method influenced the abundance of flowering plant species in New Zealand over time (2) Does the pollination method affect the ratio of threat status (3) Does the pollination method matter when it comes to flower colour in New Zealand indigenous plants?

2. Material and methods

The relationship between collected herbaria specimens, the conservation status and flower colour of New Zealand plant species was investigated to see associations to the method of pollination.

2.1 List of plant species, flower colours and conservation status

A list of vascular plants indigenous to New Zealand (de Lange & Rolfe, 2010) was imported into Excel for further work. The list contains the name of each species, which family it belongs to, the chromosome number, endemic status and conservation status. The chromosome count and endemic status was not further investigated in this study. Any symbols and abbreviations that the list contained, as described on page iv in de Lange & Rolfe (2010), was removed except subsp., var. and f. which was handled separately, see section 2.1.3.

2.1.1 Flower Colours

Data of flower colours was collected from the New Zealand Plant Conservation Network (2021) where each flower colour given (black, blue, brown, cream, green, grey, lavender, orange, purple, red/pink, violet/purple, white, yellow or no flower) of native plants was selected as the search criteria and then downloaded separately. The data was imported into Excel and matched to the existing list of species using Scientific Name. The colours were each added to separate columns and the sum of colours for each species was calculated in order to see which species did not have any data for flower colour (0 = No data). No flower was treated as a colour (or information on flowering status) and is not included in the no data-section.

2.1.2 Update of conservation status

A newer version of conservation status for New Zealand plants was released for the year 2017 (de Lange et al., 2018). This supersedes the conservation status from the 2010-version of indigenous vascular plants (de Lange & Rolfe, 2010) and the conservation status thereby needed to be updated for this analysis. This was done by importing the data from de Lange et al. (2018) and it was then matched to the previous data as described above and added into a separate column.

2.1.3 Update of names

After adding the data for flower colours and updating the conservation status it was evident that some of the species did not have automatic matches. A reverse comparison (matching the Scientific Names) of the flower colour-data (New Zealand Plant Conservation Network, 2021), and conservation status (de Lange et al., 2018) respectively, to the checklist (de Lange & Rolfe, 2010) was performed which showed that all species did not in fact match up. A manual check and update of said species was performed where the species name and family were compared to the taxonomical information and synonyms (older names etc.) from the New Zealand Plant Conservation Network (2021). This also identified species that were not to be included in the analysis of this study (see Table A1). In some cases, the species did not match up due to inconsistent spelling between datasets and these were simply corrected. Updating the names and/or family resulted in more matches, adding information to the flower colours and threat status.

Many of the plant species in New Zealand are divided into subspecies, varieties or forms, as can be seen in de Lange & Rolfe (2010). For further analysis on a species level in this study these needed to be removed and in the cases where there was only one version of a species the subspecies, variety or form followed by the remaining name of the subgroup were deleted. In the cases where several subgroups, or a main species (in addition to the subgroups) were present the information from all of them, such as flower colour, were compiled into the main species in order not to lose any information. When it came to conservation status the status out of all of the main and subgroups with the least threatened status was chosen. The list of plant species that was finally used for analysis in this study is found in Table B1.

2.2 Method of Pollination

After an extensive literature search no full list of pollination method for New Zealand plants was found. The pollination method was therefore determined for each species (or sometime whole family, see below) with further literature reviews. The result of this is found in Table B1 (in Appendix B - Method of Pollination and Conservation Status) and referenced in Appendix C (References to Method of Pollination). When sources did not agree on the pollination method the following was used as a general determination method: Specific sources was chosen over more general ones. For example: a study on a specific species or pollination method was selected over a more general study on a whole family. Mentioning of specific species was included, especially if they were mentioned to differ from the rest of their family. Recent sources were assumed to be more reliable than earlier information whereby the newest source was chosen. Pollination information on whole families was determined to be sufficient if more

specific sources could not be found within the given time frame of this study. Extra work went into identifying bird pollinated species and included in this group are also species that are occasionally visited or suspected to be bird pollinated (Pollination method: Bird or Bird/insect in Table B1). In order to minimize the variation in propagation techniques between different groups of plants only angiosperms were included for further analysis. As can be seen by the literature review of pollination method (see Table B1 in Appendix B with references in Appendix C), no bird pollinated species are found in the non-angiosperm groups whereby they (lycophytes, ferns and gymnosperms) were excluded.

2.3 Analysis of Collection Patterns

This study investigates how the collection patterns of herbaria specimens have changed over time, in order to assess changes in abundance. To do this open access data of collected herbaria specimens was obtained from the Global Biodiversity Information Facility (GBIF) (GBIF.org, 2021). New Zealand was chosen as the Country or area and only preserved specimens from the kingdom Plantae were included. 405 292 occurrences from 117 datasets were retrieved (GBIF.org, 2021).

The GBIF-data was further handled in R, version 4.0.3, (R Core Team, 2020) where it was sorted according to genus, specific epithet and year and observations with missing data in any of these sections was removed. The data from Table B1 was added into R in order to match the list of species therein to the occurrence data from GBIF. The median of the GBIF-data was found to be 1980. To calculate occurrences before and after the median, as well as the total number of specimens for each species, a for-loop was run to compile the occurrence results for each species into separate columns. To reduce an excessive dependency on species with very few herbaria specimens (Robinson et al., 2018) species with a total value of 10 observations or less was excluded from the dataset (635 excluded species). A table to combine the GBIF-results with the pollination method was created. Each species was sorted into whether it had the greatest number of observations before or after the median, thereby showing a decline or an increase in collected specimens over time, and according to pollination method (bird or other), see Table 1. A Fisher's Exact Test for Count Data for Collection Patterns was performed (see Appendix D).

2.4 Analysis of Threat Status

This study also investigates if the pollination method affects the threat status. To test this the data was put into another table in R were the species, apart from being sorted into pollination method (bird or other), was classified as threatened or not threatened, see Table 2. The threatened category in this study includes the following most threatened conservation statuses: At risk-Declining, At risk-Relict, Extinct, Threatened-Nationally Critical, Threatened-Nationally Endangered and Threatened-Nationally Vulnerable. The Not Threatened category, which is the least threatened status, was classified by itself. The remaining conservation statuses (Data Deficient, At risk-Recovering, At risk-Naturally Uncommon, Non-resident Native, Vagrant, Coloniser, Introduced and naturalised) was ignored due to uncertainties in the interpretation of the actual threat of said statuses. A Fisher's Exact Test for Count Data for Threat Status was then performed (see Appendix D).

2.5 Analysis of Flower Colours

In order to test if there was equal distribution of flower colours, independent of pollination method the following was done (see Appendix D). A table to compile the data for flower colour was created in R where the number for each colour and for each pollination method (bird or other) as well as the total number of each colour was summarised (see Table E1). To show the percental distribution of flower colours within each pollination method a figure was created, see Figure 1. A Pearson's Chi-Square Test for Flower Colour was then performed where the bird pollinated flower colour data was tested against other pollination methods.

3. Results

The results show that the collection patterns and flower colours depend on the pollination method while the results of the threat status are non-significant.

3.1 Number and distribution of Collection Patterns

The decreased or increased number of collected herbaria specimens of plant species over time, meaning the greatest amount of specimens collected before or after the median year (1980), that are bird or non-bird pollinated is presented in Table 1. Out of the herbaria specimens 61,5% of the ornithophilous species (with a total number of 260) had a majority of collections before 1980 (a decline of collected specimens over time) and 38,5% after (an increase of collected specimens over time). For other pollination methods (1083 species in total) the numbers were 51,2% before 1980 (decline) and 48,8% after (increase).

Table 1: The change in abundance for bird or non-bird pollinated angiosperm plant species in New Zealand. The number of species where the majority of the herbaria specimens were collected before or after the median year (1980) are summarized. Species with 10 or less observations in total were excluded from this study.

Pollination	Species with a majority of specimens pre-1980 (likely declining)	Species with a majority of specimens post-1980 (likely increasing)
Bird	160	100
Other	554	529

3.1.1 Number of collected specimens are dependent on Pollination Method

The result of Fisher's Exact Test for Count Data for Collection Patterns rejects the null hypothesis of equal distribution, independent of pollination method, before and after the median year (1980). It shows a highly significant difference in the number of species pre-1980 and post-1980 for species pollinated by birds to species pollinated by other methods (p value = .0029).

3.2 Number and distribution of Threatened Species

The number of threatened and non-threatened species of bird pollinated and non-bird pollinated species are found in Table 2. 18,8% out of the ornithophilous species (with a total number of 218) are threatened while the remaining 81,2% is not threatened. For non-bird pollinated species (with a total number of 932) the percentages were 15,7% and 84,3% respectively.

Table 2: The number of Threatened and Not Threatened angiosperm plant species that are either bird pollinated or not. Included in the Threatened category is the following conservation statuses: At risk-Declining, At risk-Relict, Extinct, Threatened-Nationally Critical, Threatened-Nationally Endangered and Threatened-Nationally Vulnerable. The Not threatened category only includes Not Threatened conservation status.

Pollination	Not threatened	Threatened
Bird	177	41
Other	786	146

3.2.1 Treat Status is not clearly dependent on Pollination Method

The result of Fisher's Exact Test for Count Data for Threat Status dependent on pollination method (bird or other) is inconclusive and does not show a significant dependency with a p value = .26.

3.3 Distribution of Flower Colours

The distribution of flower colours for each colour of ornithophilous plants (with a total of 449 colour matches) and plants pollinated by other methods (with a total of 2735 colour matches) are shown in Figure 1. Some plant species have more than one colour resulting in the total sum of colour matches to exceed the total number of species.

3.3.1 Flower Colour depends on Pollination Method

The Pearson's Chi-Square Test for Flower Colours rejects the null hypothesis that the distribution of flower colours is independent of pollination method. When it comes to flower colour there is a highly significant dependency between pollination method and flower colour (p value < .001). The distribution of flower colours (%) can be found in Figure 1 and exact numbers are found in Table E1.

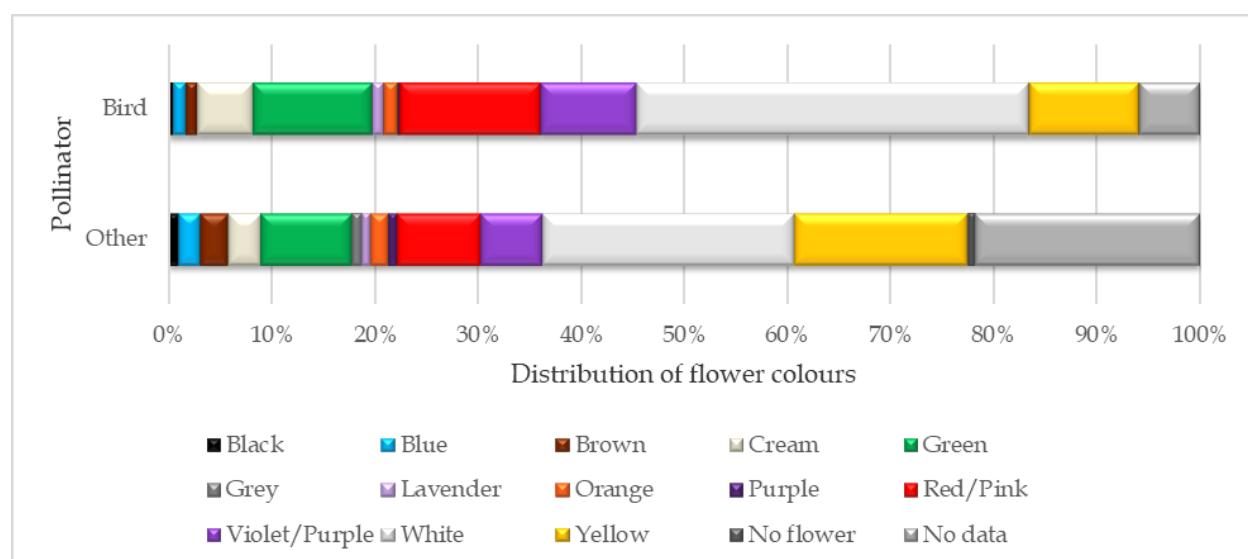

Figure 1. Distribution of flower colours depending on pollination method. Pollination methods are: bird (n=449) and other (n=2735). Exact numbers can be found in Table E1.

4. Discussion

The results of this study show a declining abundance of bird pollinated species of angiosperm plants in New Zealand in recent history. This trend of decline is further supported by an elevated threat status for bird pollinated plant species, even though these findings are not statistically significant. When it comes to flower colours a clear dependency on pollination method is evident, however, the colour red is neither the most common flower colour in bird pollinated plant species and far from all bird pollinated flowers are red.

4.1 Declining temporal abundance of bird pollinated angiosperms

The results show an uneven temporal pattern for ornithophilous flowers and that they are collected at a lesser extent (a declining abundance) after the median year (1980). Non-bird pollinated flowers however, have a fairly equal distribution in their collection pattern and thereby an even abundance over time. The decline in bird pollinated species is likely due to the extensive bird extinction that has already occurred in New Zealand (Barnett, 2011) and exhibits the same trend of a co-dependent decline of mutualistic species as is predicted by Kearns et al. (1998).

The threat status for ornithophilous plant species is elevated to a greater extent compared to the non-bird pollinated category. Although the results of the association between threat status and pollination method does not show a statistical significance the *p* value is low and therefore points in the same direction as the highly significant decline in abundance of bird pollinated plants, supporting these results.

To study whether the abundance of angiosperm species with different pollination methods (bird or other) have changed over time, and especially if ornithophilous species shows a decline, open access data of collected herbaria specimens were used. The use of collected herbaria specimens as an indicator of abundance of species over time could, however, introduce a bias that would give an inaccurate result to reality. When it comes to preserving newly collected specimens there is less interest in the common species (Schilthuizen et al., 2015). These are most likely already well represented in a multitude of collections and would be easy to re-collect in case an older specimen is lost or damaged (Schilthuizen et al., 2015). It is much more attractive to preserve the rarer species since these are not only more difficult to acquire but may also have fewer specimens already present in the herbaria collections and thereby adds to their diversity (Schilthuizen et al., 2015). It is therefore my opinion that this bias would favour more rare species, namely the declining bird-pollinated ones, giving an overrepresentation of these in the collection pattern. Despite this, a significant decline of abundance is seen in my results.

A literature review was used as the method for determining pollination method for this study. An inclusive definition of bird pollination of flowers was chosen where suspected bird pollinated plants was included into the category. If these assumptions will turn out to be wrong, a number of non-bird pollinated species will have been inaccurately added to the bird pollinated category. This random sample of, as it would then show, non-bird pollinated species would logically have a similar distribution of data as the non-bird

pollinated category. The results show that the non-bird pollinated category is fairly equally distributed in all tests (although perhaps to a lesser extent for flower colours) compared to the bird pollinated species. Thus, if a number of what is suspected to be bird pollinated species turns out to not in fact be bird pollinated, these species would dilute the result and weaken the significance of the tests. This dilution could reach the point where the results are no longer statistically significant and may very well be the explanation to the lack of significance in association between pollination method and threat status. An additional study focusing on the change of conservation status over time would add information in order to make a more accurate conclusion of a potential increase of threatened status for bird pollinated plants, thereby supporting a possible true decline in these species. The decline in abundance that is seen for ornithophilous plants does, despite this potential bias of dilution, show a highly significant result and may therefore even be an underestimation of the true decline in genuinely bird pollinated species.

4.2 Analysing Flower Colour in New Zealand

When setting up this study the expectation that the pollination method of bird (ornithophily) could be determined by using the colour red was assumed, since red flower colour are usually a definition for bird pollinated plants. After studying the pollination syndromes of bird pollinated flowers the aspects of large flower size, lack of scent and the tubular shape of flowers also needed to be considered in order to make this determination (Cronk & Ojeda, 2008). Flowers in New Zealand does, however, not conform to common pollination syndromes when it comes to bird pollination (Anderson, 2003). This, along with the generalistic approach using multiple pollinators across the islands, creates an obstacle in easily identifying which flowers are in fact reliant on bird pollination (Anderson, 2003; Kearns & Inouye, 1997). Historically this has also been shown to be a problem, resulting in birds being underestimated as pollinators in New Zealand flora (Anderson, 2003; Clout & Hay, 1989). Due to this, a literature review was chosen as the method for identifying and summarising bird pollinated flowers instead.

The flower colour was however still of interest to investigate in order to review different results from previous work, as seen in Anderson (2003); Cronk & Ojeda (2008) and Wang et al., (2020). The flower colours of New Zealand angiosperms were therefore tested against pollination method. The comparison between flower colours and pollination method shows that not all bird pollinated flowers are red as there are more white (38.1%) flowers that are bird pollinated than there are red (13.6%) flowers. Red is however the second most common colour for ornithophilous species. Neither are all red flowers bird pollinated as only 21.6% of all red flowers are classified as bird pollinated.

There was, however, a highly statistical significance between flower colour and pollination method. This can be seen in the colour distribution as it is not the same between bird pollinated and non-bird pollinated flowers. The most common ornithophilous flower colours are white (38.6%), red (13.6%) and green (11.6%) which are all overrepresented compared to the non-bird pollinated species (where the distribution is: white (24.5%), red (8.1%) and green (8.8%)). Yellow (10.7%) is underrepresented for bird pollinated species (compared to 16.7 % for other pollination methods) even though it is the fourth most common colour in the bird pollinated

category. The conclusion of this is that the flower colours are not random and independent of pollination method. Some colours are more probable for bird pollinated flowers than others. This study has however not investigated in what way these are correlated and would be relevant for further investigations.

4.3 Heading into the future

The decline of bird pollinated angiosperms in New Zealand might in a way be mitigated due to the generalistic pollination strategy exhibited on the islands (Anderson, 2003). This means that the flowering plants can utilise more than just one type of pollinator whereby, for example, insects might cover for potentially lost bird pollinators (Kearns & Inouye, 1997; Wang et al., 2020). It has however been shown that insects can only partially compensate for the loss of bird pollinators (Anderson, 2003; Kelly et al., 2010). A plant species may also remain extant for a certain time after their pollinators have disappeared, either through vegetative propagation, asexual reproduction, autonomous selfing or simply due to long generation times (Harter et al., 2015; Kearns & Inouye, 1997; Newstrom & Robertson, 2005). If the evolutionary success rate of native species continues to decline, for example through a lack of sexual outcrossing between generations due to a loss of pollinators, they may very well be doomed for extinction. It remains to be seen if these species will continue to decline, as has been seen in this study, or if a new steady state is reached. The extensive conservation efforts exhibited in New Zealand might help to mitigate this decline in the future (Bombaci et al., 2018; Iles & Kelly, 2014; Van Etten et al., 2018).

5. Conclusion

The results show a clear decline in abundance of bird pollinated angiosperm plant species over time in New Zealand, when based on the temporal pattern of collected herbaria specimens. This indicates that ornithophilous flowers are following in the tracks of their already depleted pool of mutualistic bird pollinators in New Zealand (Kelly et al., 2006).

When studying the threat status of plant species in New Zealand the result is not statistically significant but does point in the same general direction as the collection patterns with a greater percentage of bird pollinated species having a threatened status compared to non-bird pollinated species. This can potentially indicate the same deterioration of ornithophilous plants as seen in the collection pattern. A significance in the result may here have been obscured by the inclusive approach used to categorizing bird pollinated species. Using a different approach to determining the pollination method may come to a different result and lead to a more distinct conclusion.

When determining the pollination method for plants the previous use of common pollination syndromes may have diminished the importance of bird pollinators in New Zealand since the flowers of the islands does not adhere to these to any great extent (Anderson, 2003). The results of this study support this conclusion.

6. Acknowledgement

I would like to express my deepest appreciation to my supervisor Søren Faurby who has not only contributed with great scientific knowledge and professionalism but has guided me through a weekly progression using constructive instructions. This thesis has not only been interesting, but I have also learnt a lot and Søren's support, quick response, invaluable navigations through R, and belief in my ability was paramount for a smooth success and the completion of this work.

I also wish to thank Johan Uddling for agreeing to be my examiner on this project, as well as sparking my interest for many subjects throughout the education along with other teachers and experts at Gothenburg University. Amongst these are Åsa Arrhenius and Lennart Bornmalm, the course coordinators, who has supported my classmates and I throughout the process. I am also grateful to Natàlia Corcoll, Gothenburg University, for introducing me to the excellent referencing system used in the making of this thesis. I would also like to extend a thank you to my classmates, as well as all the participants on the GBC:s Monday meetings, for sharing your work and inspiring me.

Many thanks to my family and friends for supportive phone calls and invigorating picnicks, cheering me on and keeping the steam going.

I cannot begin to express my thanks to my amazing boyfriend who has put up with my distracted brain and stood beside me, showing immense patience and support not only through this master thesis but also my bachelor's thesis. If this is what the future will hold, it can be nothing but magical.

Appendix A - Plant species excluded from this study

Table A1: Plant species from de Lange et al. (2010) excluded from this study. Reason for exclusion is given in the table. All species belong to the phylogenetic group Core Eudicots and they all had a Not Threatened Conservation Status according to de Lange et al. (2010). Pollination method is given, and references are listed in Appendix C. Reason for exclusion is based on: New Zealand Plant Conservation Network (2021).

Species name 2021	Family	Pollination method	Source: pollination	Reason for exclusion
<i>Anisotome procumbens</i>	Apiaceae	Insect	19, 21	No match in database (native plants). Exotic?
<i>Plantago masoniae</i>	Plantaginaceae	Wind	21, 38	Now included in <i>Plantago triandra</i>
<i>Coprosma grandifolia</i>	Rubiaceae	Wind	21, 22	Now included in <i>Coprosma lucida</i>

Appendix B – Method of Pollination and Conservation Status

Table B1: Name of each plant species included in this study, the family and phylogenetic group it belongs to, which pollination method and conservation status the plant has. References to Pollination Method are listed in Appendix C. Source of Conservation Status: de Lange et al. 2018. *Phylogenetic groups not included in analyses are: Lycophtyes, Ferns and Gymnosperms.

Species name 2021	Family	Phylogenetic group	Pollination method	Reference: pollination	Conservation status 2017
<i>Isoetes alpina</i>	Isoetaceae	Lycophtyes*	Spores: wind (water)	4	Not Threatened
<i>Isoetes kirkii</i>	Isoetaceae	Lycophtyes*	Spores: wind (water)	4	At risk - Declining
<i>Huperzia australiana</i>	Lycopodiaceae	Lycophtyes*	Spores: wind (water)	4	Not Threatened
<i>Lycopodiella cernua</i>	Lycopodiaceae	Lycophtyes*	Spores: wind (water)	4	Not Threatened
<i>Lycopodiella diffusa</i>	Lycopodiaceae	Lycophtyes*	Spores: wind (water)	4	Not Threatened
<i>Lycopodiella lateralis</i>	Lycopodiaceae	Lycophtyes*	Spores: wind (water)	4	Not Threatened
<i>Lycopodiella serpentina</i>	Lycopodiaceae	Lycophtyes*	Spores: wind (water)	4	Threatened - Nationally Vulnerable
<i>Lycopodium deuterodensum</i>	Lycopodiaceae	Lycophtyes*	Spores: wind (water)	4	Not Threatened
<i>Lycopodium fastigiatum</i>	Lycopodiaceae	Lycophtyes*	Spores: wind (water)	4	Not Threatened
<i>Lycopodium scariosum</i>	Lycopodiaceae	Lycophtyes*	Spores: wind (water)	4	Not Threatened
<i>Lycopodium volubile</i>	Lycopodiaceae	Lycophtyes*	Spores: wind (water)	4	Not Threatened
<i>Phlegmariurus varius</i>	Lycopodiaceae	Lycophtyes*	Spores: wind (water)	4	Not Threatened
<i>Phylloglossum drummondii</i>	Lycopodiaceae	Lycophtyes*	Spores: wind (water)	4	Threatened - Nationally Endangered
<i>Asplenium appendiculatum</i>	Aspleniaceae	Ferns*	Spores: Wind	3	Not Threatened
<i>Asplenium bulbiferum</i>	Aspleniaceae	Ferns*	Spores: Wind	3	Not Threatened
<i>Asplenium chathamense</i>	Aspleniaceae	Ferns*	Spores: Wind	3	At risk - Naturally Uncommon
<i>Asplenium cimmeriorum</i>	Aspleniaceae	Ferns*	Spores: Wind	3	At risk - Naturally Uncommon
<i>Asplenium decurrens</i>	Aspleniaceae	Ferns*	Spores: Wind	3	Not Threatened

<i>Machaerina arthrophylla</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Machaerina articulata</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Machaerina complanata</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Threatened - Nationally Vulnerable
<i>Machaerina juncea</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Machaerina rubiginosa</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Machaerina sinclairii</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Machaerina tenax</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Machaerina teretifolia</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Morelotia affinis</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Netrostylis capillaris</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Oreobolus impar</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Oreobolus pectinatus</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Oreobolus strictus</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Schoenoplectus pungens</i>	Cyperaceae	Monocots II - Commelinids	Wind	22, 38	Not Threatened
<i>Schoenoplectus tabernaemontani</i>	Cyperaceae	Monocots II - Commelinids	Wind	22, 38	Not Threatened
<i>Schoenus apogon</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Schoenus brevifolius</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Schoenus caespitosus</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Schoenus carsei</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Threatened - Nationally Critical
<i>Schoenus concinnus</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Schoenus fluitans</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Schoenus maschalinus</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Schoenus nitens</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Schoenus pauciflorus</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Schoenus tendo</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Scirpus polystachyus</i>	Cyperaceae	Monocots II - Commelinids	Wind	22, 38	Non - Resident Native Coloniser
<i>Uncinia viridis</i>	Cyperaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Juncus antarcticus</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened

<i>Juncus australis</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Juncus caespiticius</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Declining
<i>Juncus distegus</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Juncus edgariae</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Juncus holoschoenus</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Threatened - Nationally Critical
<i>Juncus kraussii</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Juncus novae-zelandiae</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Juncus pallidus</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Juncus pauciflorus</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Threatened - Nationally Vulnerable
<i>Juncus planifolius</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Juncus prismatocarpus</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Juncus pusillus</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Juncus sarophorus</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Juncus scheuchzerioides</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Juncus usitatus</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Luzula banksiana</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Luzula celata</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Declining
<i>Luzula colensoi</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Luzula crenulata</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Luzula crinita</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Luzula decipiens</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Luzula leptophylla</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Luzula picta</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Luzula pumila</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Luzula rufa</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Luzula subclavata</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Luzula traversii</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Luzula ulophylla</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Declining
<i>Marsippospermum gracile</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Rostkovia magellanica</i>	Juncaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Achnatherum petriei</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Declining

<i>Agrostis dyeri</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Agrostis imbecilla</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Data deficient
<i>Agrostis magellanica</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Agrostis muelleriana</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Agrostis muscosa</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Agrostis oresbia</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Agrostis pallidescens</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Agrostis personata</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Agrostis petriei</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Agrostis subulata</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Amphibromus fluitans</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Threatened - Nationally Vulnerable
<i>Anemanthele lessoniana</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Relict
<i>Anthosachne aprica</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Anthosachne falcis</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Declining
<i>Anthosachne kingiana</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Declining
<i>Anthosachne sacandros</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Anthosachne solandri</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Australopyrum calcis</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Threatened - Nationally Endangered
<i>Austroderia fulvida</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Austroderia richardii</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Austroderia splendens</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Austroderia toetoe</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Austroderia turbaria</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Threatened - Nationally Endangered
<i>Austrostipa stipoides</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Bromus arenarius</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Cenchrus caliculatus</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Chionochloa acicularis</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Chionochloa antarctica</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Chionochloa australis</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Chionochloa beddiei</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Chionochloa bromoides</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon

<i>Chionochloa cheesemanii</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Chionochloa conspicua</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Chionochloa crassiuscula</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Chionochloa defracta</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Chionochloa flavescens</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Chionochloa flavicans</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Chionochloa juncea</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Declining
<i>Chionochloa lanea</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Chionochloa macra</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Chionochloa nivifera</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Chionochloa oreophila</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Chionochloa ovata</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Declining
<i>Chionochloa pallens</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Chionochloa rigida</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Chionochloa rubra</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Chionochloa spiralis</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Chionochloa teretifolia</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Chionochloa vireta</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Connorochloa tenuis</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Data deficient
<i>Deschampsia cespitosa</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Declining
<i>Deschampsia chapmanii</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Deschampsia gracillima</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Deschampsia pusilla</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Deschampsia tenella</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Deyeuxia aucklandica</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Deyeuxia avenoides</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Deyeuxia lacustris</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Threatened - Nationally Critical
<i>Deyeuxia quadrisetata</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Declining
<i>Deyeuxia youngii</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Dichelachne crinita</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Dichelachne inaequiglumis</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon

<i>Dichelachne lautumia</i> Edgar & Connor	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Threatened - Nationally Endangered
<i>Dichelachne micrantha</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Threatened - Nationally Vulnerable
<i>Echinopogon ovatus</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Festuca actae</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Festuca contracta</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Festuca coxii</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Festuca deflexa</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Festuca luciarum</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	At risk - Naturally Uncommon
<i>Festuca madida</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened
<i>Festuca matthewsii</i>	Poaceae	Monocots II - Commelinids	Wind	21, 22, 38	Not Threatened

<i>Olearia fimbriata</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	Threatened - Nationally Vulnerable
<i>Olearia fragrantissima</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	At risk - Declining
<i>Olearia furfuracea</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	Not Threatened
<i>Olearia gardneri</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	Threatened - Nationally Endangered
<i>Olearia hectorii</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	Threatened - Nationally Endangered
<i>Olearia ilicifolia</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	Not Threatened
<i>Olearia lacunosa</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	Not Threatened
<i>Olearia lineata</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	At risk - Declining
<i>Olearia lyallii</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	At risk - Naturally Uncommon
<i>Olearia moschata</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	Not Threatened
<i>Olearia nummulariifolia</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	Not Threatened
<i>Olearia odorata</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	Not Threatened
<i>Olearia oporina</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	At risk - Naturally Uncommon
<i>Olearia pachyphylla</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	Threatened - Nationally Critical
<i>Olearia paniculata</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	Not Threatened
<i>Olearia polita</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	Threatened - Nationally Endangered
<i>Olearia quinquevulnera</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	At risk - Naturally Uncommon
<i>Olearia rani</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	Not Threatened
<i>Olearia semidentata</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	At risk - Naturally Uncommon
<i>Olearia solandri</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	Not Threatened
<i>Olearia telmatica</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	Threatened - Nationally Vulnerable
<i>Olearia townsonii</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	Not Threatened
<i>Olearia traversiorum</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	Threatened - Nationally Vulnerable
<i>Olearia virgata</i>	Asteraceae	Core Eudicots	Insect	9, 21, 22, 32	Not Threatened
<i>Ozothamnus leptophyllus</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened

<i>Ozothamnus vauvilliersii</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Pachystegia insignis</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Pachystegia minor</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Naturally Uncommon
<i>Pachystegia rufa</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Naturally Uncommon
<i>Picris angustifolia</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Naturally Uncommon
<i>Picris burbridgeae</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Threatened - Nationally Vulnerable
<i>Pleurophyllum criniferum</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Naturally Uncommon
<i>Pleurophyllum hookeri</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Naturally Uncommon
<i>Pleurophyllum speciosum</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Naturally Uncommon
<i>Pseudognaphalium ephemerum</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Threatened - Nationally Critical
<i>Pseudognaphalium luteoalbum</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Rachelia glaria</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Naturally Uncommon
<i>Raoulia albosericea</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Raoulia apicinigra</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Raoulia australis</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Declining
<i>Raoulia beauverdii</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Declining
<i>Raoulia bryoides</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Raoulia buchananii</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Raoulia cinerea</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Naturally Uncommon
<i>Raoulia eximia</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Raoulia glabra</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Raoulia goyenii</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Naturally Uncommon
<i>Raoulia grandiflora</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Raoulia haastii</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Raoulia hectorii</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Raoulia hookeri</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Raoulia mammillaris</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Raoulia monroi</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Threatened - Nationally Vulnerable
<i>Raoulia parkii</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Declining
<i>Raoulia petriensis</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Naturally Uncommon
<i>Raoulia rubra</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Naturally Uncommon

<i>Raoulia subsericea</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Raoulia subulata</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Raoulia tenuicaulis</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Raoulia youngii</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Senecio australis</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Non - resident Native Vagrant
<i>Senecio banksii</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Naturally Uncommon
<i>Senecio biserratus</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Declining
<i>Senecio carnosulus</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Declining
<i>Senecio colensoi</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Naturally Uncommon
<i>Senecio diaschides</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Senecio dunedinensis</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Naturally Uncommon
<i>Senecio esleri</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Senecio esperensis</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Threatened - Nationally Critical
<i>Senecio glaucophyllus</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Senecio glomeratus</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Senecio hauwai</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Threatened - Nationally Endangered
<i>Senecio hispidulus</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Senecio kermadecensis</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Threatened - Nationally Critical
<i>Senecio laetus</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Senecio marotiri</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Naturally Uncommon
<i>Senecio minimus</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Senecio quadridentatus</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Senecio radiolatus</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Naturally Uncommon
<i>Senecio repangae</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Naturally Uncommon
<i>Senecio rufiglandulosus</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Senecio scaberulus</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Threatened - Nationally Critical
<i>Senecio sterquilinus</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Naturally Uncommon
<i>Senecio wairauensis</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Sonchus grandifolius</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Recovering
<i>Sonchus kirkii</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	At risk - Declining
<i>Sonchus novae-zelandiae</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Threatened - Nationally Vulnerable

<i>Taraxacum magellanicum</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened
<i>Traversia baccharoides</i>	Asteraceae	Core Eudicots	Insect	9, 21, 32	Not Threatened

Appendix E – Flower Colour by Method of Pollination

Table E1: Number of each flower colour grouped by bird pollination (n=449) or other pollination method (n=2735) as well as the total number for each flower colour.

Colour:	Pollinated by bird	Pollinated by other	Total for each colour
Black	2	28	30
Blue	6	58	64
Brown	5	73	78
Cream	24	88	112
Green	52	240	292
Grey	0	28	28
Lavender	5	23	28
Orange	6	45	51
Purple	1	26	27
Red/Pink	61	222	283
Violet/Purple	42	162	204
White	171	670	841
Yellow	48	458	506
No flowers	0	23	23
No data	26	591	617
